

## Problems

of children to communicate their health symptoms

## limited vocabulary

to accurately describe their symptoms or how they are feeling

### fear of the unknown

e.g. fear of medical equipment or procedures can make them reluctant to communicate openly.

## anxiety and stress

related to medical appointments, e.g. due to fear of pain, fear of needles, fear of separation from parents, or fear of being judged

## cultural and familiar influences

Cultural beliefs and family attitudes towards illness can impact how comfortable children feel discussing their symptoms

#### ABSTRACT

In terms of Human–Computer Interaction, healthcare presents p investment in innovative health technologies, particularly aro technologies; on the other hand, most interactive health technologies; on the other hand, most interactive health technologies have achieved si of change, with a shift from care being delivered by professional engaged and involved in shared decision making. Technically, togies and information resources; culturally, the pace of change of space of interactive health technologies, users and uses, and review of the past and present, I highlight opportunities for and the design and deployment of digital health technologies. Thes experience, and opportunities to deliver healthcare and empower ways that better fit their lives and values.

Somatics practices explicitly frame an ethical relationship between care of self and our capacity to care for and act in the world. Somatics proposes an ameliorative practice of self-cultivation that aligns with the social tenets of research through design in HCI, which seeks to transform the world from its current state to a preferred state. The role and responsibility of the designer in SEPTEMBER-OCTOBER 2018 INTERACTIONS 55

"This comes with the realization by health authorities that in order to decrease the burden on the public health system, citizens need to be empowered with tools and techniques for monitoring and improving their own personal well-being."

"The somatic approach can also provide **tools and techniques** for an individual person to acquire some sense
of **mastery over their own mental, emotional, and physical well-being.**"

"One of the defining features of somatics is **the privileging of the subjective, first-person perception** of one's own body.

This is **in contrast to the dominant third-person views** of the body encountered **in science** [...]."

"One research strategy is to design technologies to support developing skills of experience."

## Our Gods

01

Facilitate Communication about Symptoms

02

**Enhance Comfort, Trust and Familiarity** 

03

**Monitor Health and Detect Emergencies** 

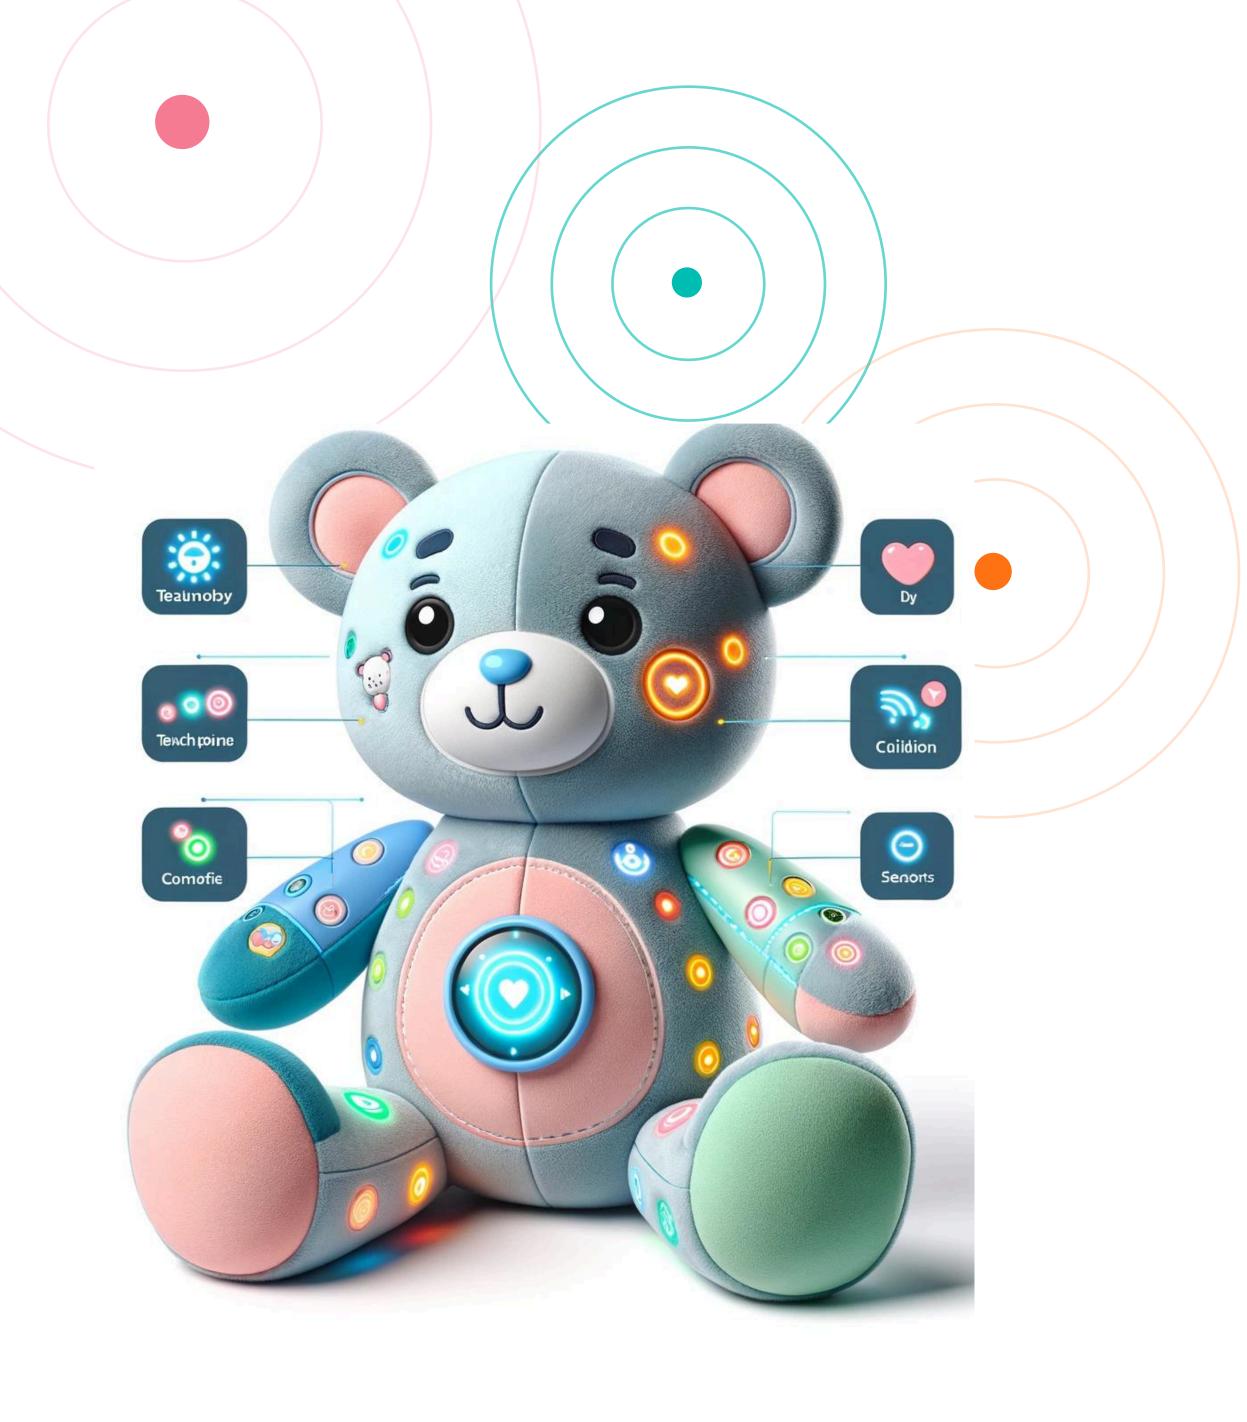

04

Support Caregivers and Healthcare Providers

## Our Solution

### CareBear

- interactive AI-powered device, specifically designed for children to communicate their health symptoms more effectively
- Children can interact with this device by pointing to where they feel pain, describing the nature of their discomfort, and even rating their pain level on a scale

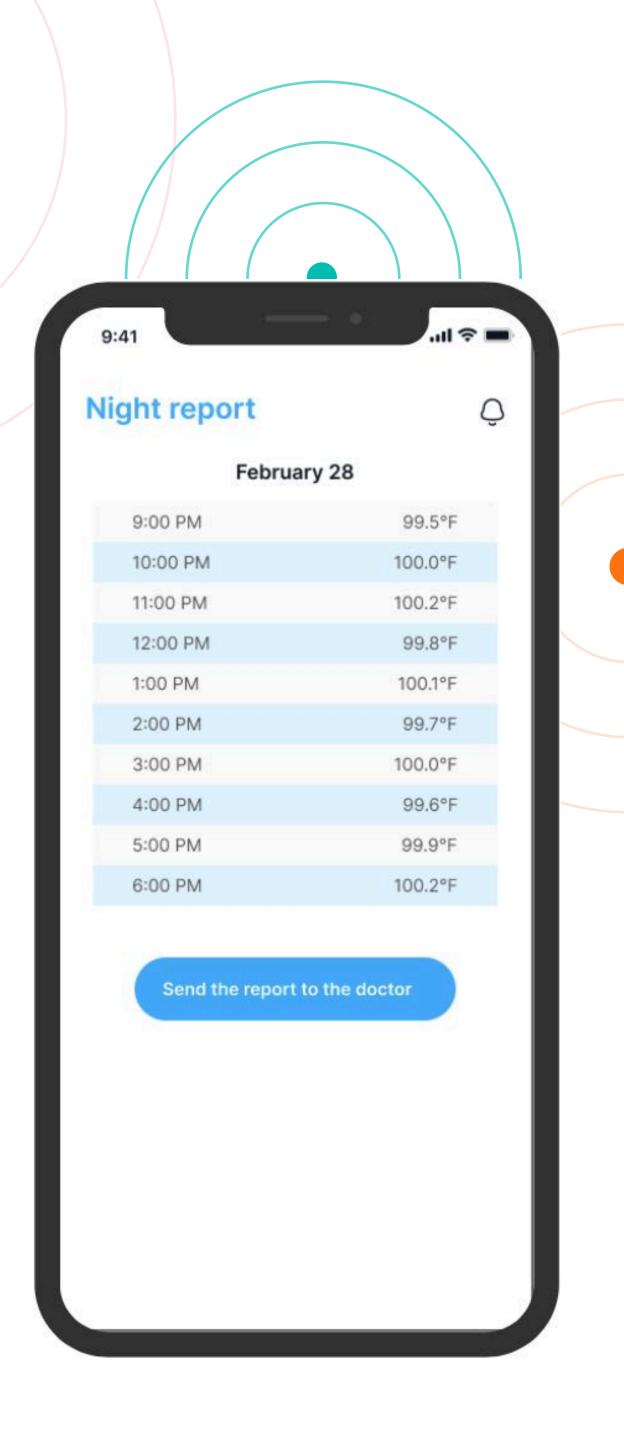

Functionalities

- measure **temperature** with a sensor
- buttons all over the bear for pressing and showing the location of the pain
- buttons measure pain levels
- camera (in the eyes) for **emotion recognition**
- speach recognition
- turn on/off features

# Al Component

- interpreting the child's input, providing initial feedback, and communicating the symptoms in a structured format to caregivers or medical professionals
- include natural language processing to understand verbal descriptions of symptoms, machine learning algorithms to interpret the location and intensity of pain based on the child's inputs, and an intuitive interface for children to interact with easily
- --> makes it easier for children to communicate their symptoms but also supports healthcare providers in diagnosing and treating children's ailments more accurately

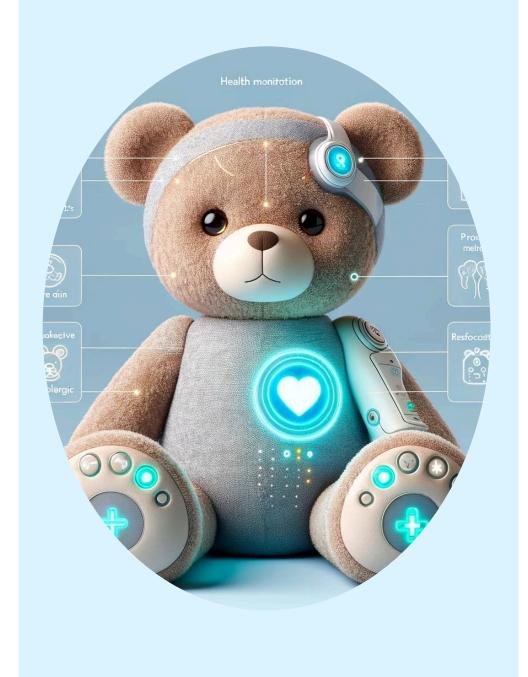

# Mobile App

**Examination Mode** 

Send a report to the doctor

With interactive buttons scattered across its surface, BearCare allows children to express their discomfort levels simply by pressing. Each press provides a tactile way for children to communicate their pain levels, ensuring caregivers can respond promptly and effectively to their needs.

**ToyBear** 

## **ToyBear**

**Cuddly companion Mode** 

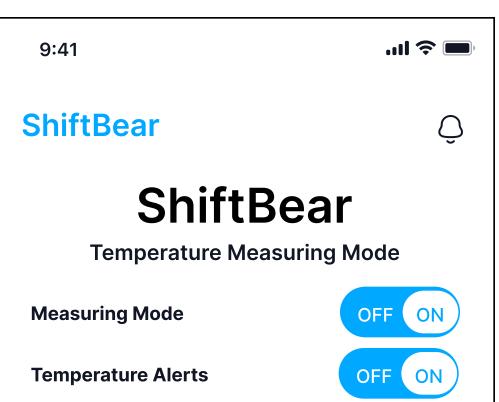

**Back to TOY** 

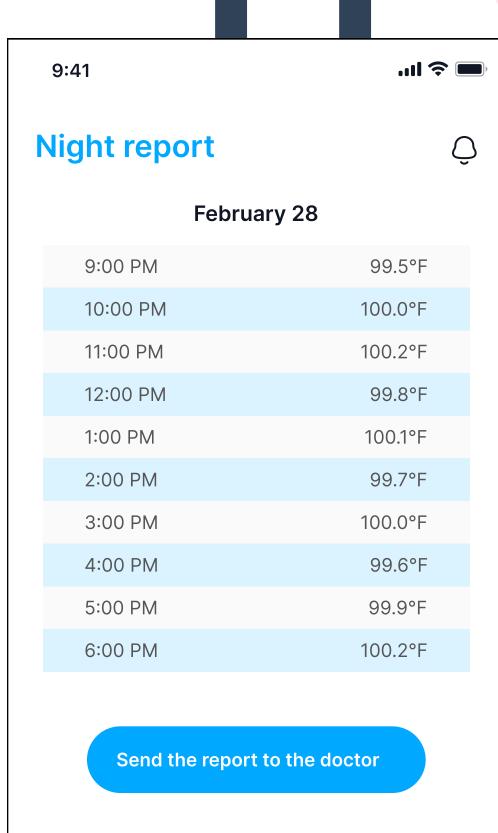

Without active functions, it transforms into a classic, timeless toy, perfect for comforting and entertaining your child during playtime or bedtime. Enjoy the simplicity and charm of BearCare as it embraces its role as a beloved plush companion.

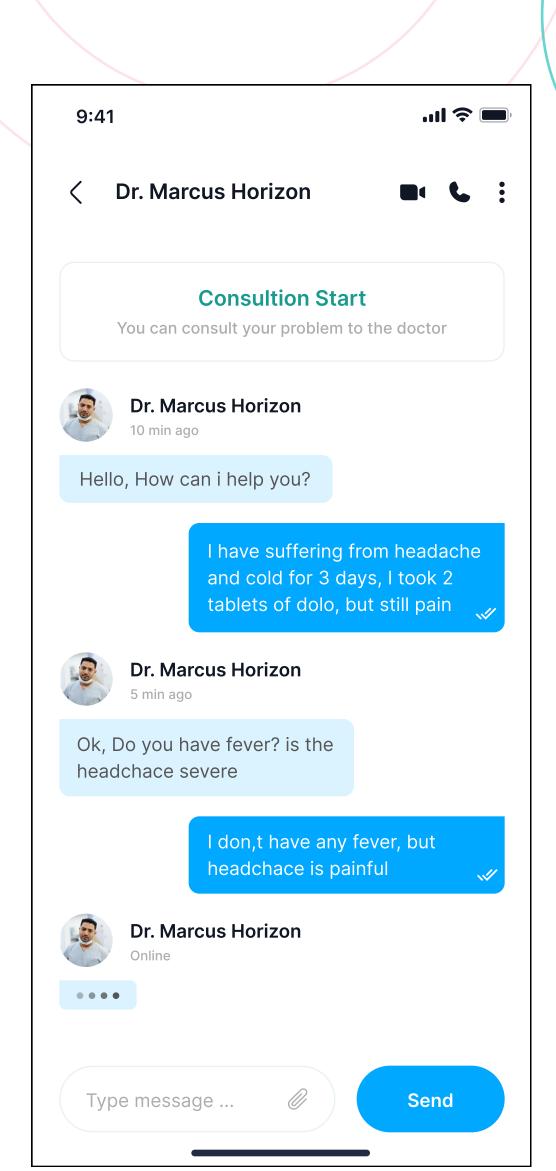

# Mobile App

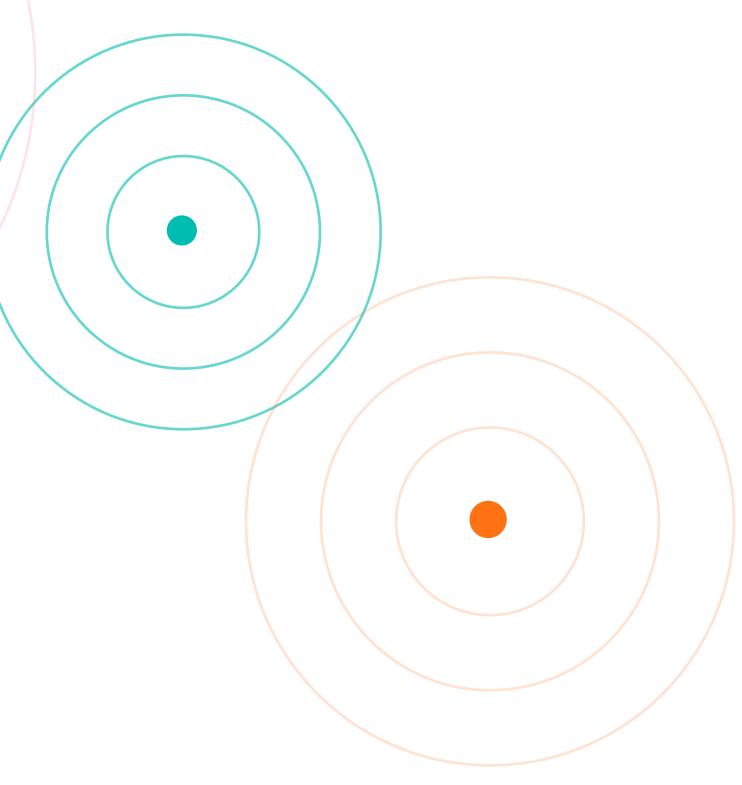

With its integrated temperature sensors, BearCare measures your child's body temperature throughout the night, sending instant notifications to parents if any unusual spikes occur, ensuring a peaceful slumber for your little one.

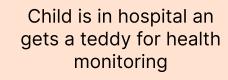

## Use Case

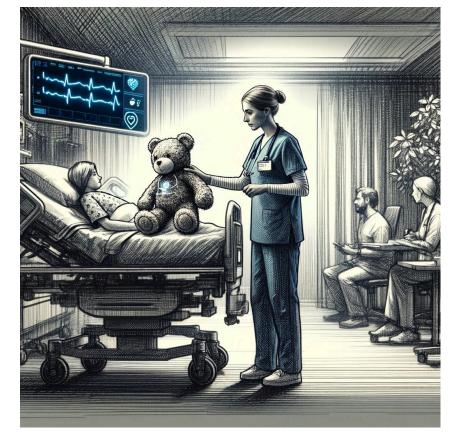

at the hospital

The teddy monitors the child's temperature, sounds and emotions during the night

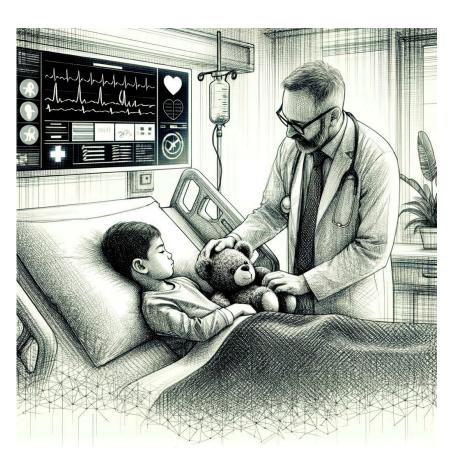

The child develops a high temperature and sends a message to the nurse (emergency detection)

The doctor comes to check the next morning and sends the data from the teddy to the app

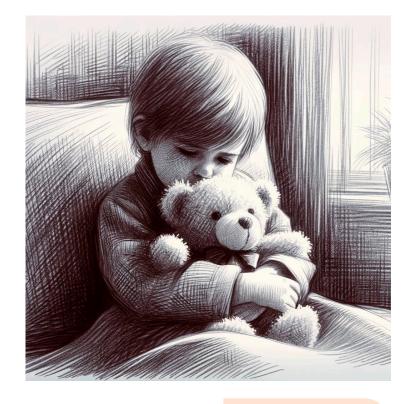

The doctor receives all data in a structured format and can quickly obtain a holistic overview of the health status

## Use Case

at home

Mom comes in and turns on the teddy with the app

Mum sits down with the child and explains that the child can show where it hurts on the teddy Teddy recognises the child's feelings and symptoms using a camera and speech recognition. The child also presses on certain points on the teddy and the pain levels are recognised by the pressure.

The mother can also chat live with a Doctor

The mum is given an overview of the symptoms in the app and receives advice

Child cuddles with teddy

## Thanks

CareBear
